**MAHATMA GANDHI UNIVERSITY**

**2019**

### Assessment

The weightage for internal & external evaluation of theory/practical/ project/comprehensive viva-voce is 5 & 15 and the maximum Weighted Grade Point (WGP) is 25 & 75 respectively, (ratio 1:3)

### Pattern of Questions

Sl.No.	Type of Questions	Weight	Number of questions to be answered
1.	Short Answer type questions	1	8 out of 10
2	Short essay/ problem solving type questions	2	6 out of 8
3.	Long Essay type questions	5	2 out of 4

## Direct Grading System

Direct Grading System based on a 7–point scale is used to evaluate the performance (External and Internal Examination of students)

For all courses (theory & practical)/semester/overall programme Letter grades and GPA/SGPA/CGPA are given on the following scale:

Range	Grade	Indicator
4.50 to 5.00	A+	Outstanding
4.00 to 4.49	A	Excellent
3.50 to 3.99	B+	Very good
3.00 to 3.49	B	Good(Average)
2.50 to 2.99	C+	Fair
2.00 to 2.49	C	Marginal
up to 1.99	D	Deficient(Fail)

Minimum **C grade** is required for pass in a course.

**Evaluation first stage** - Both internal and external (to be done by the teacher)

Grade	Grade Points
A+	5
A	4
B	3
C	2
D	1
E	0

## Weightage Distribution for External and Internal Examination

### Theory-External

Maximum weight & Maximum Weighted Grade Point (WGP) for external evaluation is **30** and **150** respectively.

**Theory-Internal (Components and Weightage)**

	<b>Components</b>	<b>Weightage</b>
i.	Assignment	1
ii	Seminar	2
iii	Best Two Test papers	1 each (2)
	<b>Total</b>	<b>5</b>

**Practical-External (Components and Weightage)**

<b>Components</b>	<b>Weightage</b>
Written / Lab test	10
Record	2
Viva	3
<b>Total</b>	<b>15</b>

**Practical-Internal (Components and Weightage)**

<b>Components</b>	<b>Weightage</b>
Written/Lab test	3
Lab involvement	1
Viva	1
<b>Total</b>	<b>5</b>

**Project- External (Components and Weightage)**

<b>Components</b>	<b>Weightage</b>
Relevance of the topic and analysis	2
Project content and presentation	8
Project viva	5
<b>Total</b>	<b>15</b>

### **Project- Internal (Components and Weightage)**

<b>Components</b>	<b>Weightage</b>
Relevance of the topic and analysis	1
Project content and presentation	3
Project viva	1
<b>Total</b>	<b>5</b>

### **Comprehensive viva-voce (External)-components and weightage**

<b>Components</b>	<b>Weightage</b>
Course viva (all courses from first semester to fourth semester)	15
<b>Total</b>	<b>15</b>

### **Comprehensive viva (Internal) - Components and Weightage**

<b>Components</b>	<b>Weightage</b>
Course viva (all courses from first semester to fourth semester)	5
<b>Total</b>	<b>5</b>

### **1. Faculty under which the Degree is awarded**

Science

### **2. Note on compliance with the UGC minimum standards for the conduct and award of Post Graduate Degrees**

Credit and Semester system is followed in this program. The program has 4 semesters with 18 weeks in each semester. In each week, there are 15 lecture hours and 10 laboratory hours. In each semester there are 270 lecture hours and 180 practical hours; thus a total of 450 calendar hours in each semester which is in compliance with the minimum 390 hours stipulated by the UGC.

## SEMESTER 1

### CH 50 01 01 ORGANOMETALLICS AND NUCLEAR CHEMISTRY

Credit: 4

Contact Lecture Hours: 72

#### Objective of the course

The learners should be able to apply and analyse the methods of synthesis and the mechanism of selected catalytic organic reactions from the structure-bonding aspects and reactivity of simple organometallic compounds, the functions of transition metal ions in biological systems and the applications of radioactive isotopes in various fields

#### Unit 1: Organometallic Compounds-Synthesis, Structure and Bonding (18 Hrs)

- 1.1 Haptonomenclature of organometallic compounds, organometallic compounds with linear pi donor ligands-olefins, acetylenes, dienes and allyl complexes-synthesis, structure and bonding.
- 1.2 Synthesis and structure of complexes with cyclic pi donors, metallocenes and cyclic arene complexes, bonding in ferrocene and dibenzenechromium, carbene and carbyne complexes.
- 1.3 Metal carbonyls: CO as a  $\pi$ -bonding ligand, synergism, preparation, properties, structure and bonding of simple mono and binuclear metal carbonyls, metal nitrosyls, metal cyanides and dinitrogen complexes. Polynuclear metal carbonyls with and without bridging. Carbonyl clusters-LNCCS and HNCCS, Isoelectronic and isolobal analogy, Wade-Mingos rules, cluster valence electrons. IR spectral studies of bridging and non-bridging CO ligands.

#### Unit 2: Reactions of Organometallic Compounds (9 Hrs)

- 2.1 Substitution reactions: Nucleophilic ligand substitution, nucleophilic and electrophilic attack on coordinated ligands.
- 2.2 Addition and elimination reactions-1,2 additions to double bonds, carbonylation and decarbonylation. Oxidative addition- concerted addition,  $S_N2$ , radical and ionic mechanisms. Reductive elimination- binuclear reductive elimination and  $\sigma$ -bond metathesis. Oxidative coupling and reductive decoupling. Insertion (migration) and elimination reactions – insertions of CO and alkenes, insertion into M-H versus M-R,  $\alpha$ ,  $\beta$ ,  $\gamma$  and  $\delta$  eliminations.
- 2.3 Redistribution reactions, fluxional isomerism of allyl, cyclopentadienyl and allene systems.

### Unit 3: Catalysis by Organometallic Compounds

(18 Hrs)

- 3.1 Homogeneous and heterogeneous organometallic catalysis: Tolman catalytic loops, alkene hydrogenation using Wilkinson catalyst.
- 3.2 Reactions of carbon monoxide and hydrogen-the water gas shift reaction, the Fischer-Tropsch reaction (synthesis of gasoline).
- 3.3 Hydroformylation of olefins using cobalt and rhodium catalysts.
- 3.4 Polymerization by organometallic initiators and templates for chain propagation-Ziegler Natta catalysts, polymerisation by metallocene catalysts.
- 3.5 Carbonylation reactions: Monsanto acetic acid process, olefin hydroformylation- oxo process, carbonylation of alkenes and alkynes in the presence of a nucleophile- the Reppe reaction. Carbonylation of aryl halides in the presence of a nucleophile.
- 3.6 Olefin metathesis-synthesis gas based reactions, photodehydrogenation catalyst ("Platinum Pop").
- 3.7 Oxidation of olefins: Palladium catalysed oxidation of ethylene-the Wacker process, epoxidation of olefins, hydroxylation by metal-oxo complexes
- 3.8 Asymmetric catalysis- Asymmetric hydrogenation, isomerisation and epoxidation.
- 3.9 C-H activation and functionalization of alkanes and arenes: Radicaltype oxidation, hydroxylation, dehydrogenation, carbonylation and regioselective borylation of alkanes and cycloalkanes. Radicaltype reactions, electrophilic reactions, carbonylation and borylation of arenes. Insertion of alkenes and alkynes in the Ar-H bond.
- 3.10 Application of palladium catalysts in the formation of C-O and C-N bonds, oxidative coupling reactions of alkynes with other unsaturated fragments for the formation of cyclic and heterocyclic compounds. The Dötz reaction.

### Unit 4: Bioinorganic Compounds

(18 Hrs)

- 4.1 Essential and trace elements in biological systems, toxic effects of metals (Cd, Hg, Cr, Pb and As), structure and functions of biological membranes, mechanism of ion transport across membranes, sodium pump, ionophores, valinomycin. Phosphate esters in biology, Redox metalloenzymes, cytochromes-cytochrome P450.
- 4.2 Oxygen carriers and oxygen transport proteins: Structure and functions of haemoglobins and myoglobin, oxygen transport mechanism, cooperativity, Bohr effect. Structure and functions of haemerythrin and haemocyanin.
- 4.3 Biochemistry of zinc and copper: Structure and functions of carbonic anhydrase, carboxypeptidase A and superoxide dismutase.

- 4.4 Other important metal containing biomolecules: Vitamin B<sub>12</sub> and the vitamin B<sub>12</sub> coenzymes, photosynthesis-chlorophyll a, PS I and PS II.
- 4.5 Role of calcium in muscle contraction, blood clotting mechanism and biological calcification. Metals in medicine-therapeutic applications of cis-platin, radioisotopes and MRI agents.

**Unit 5: Nuclear Chemistry**

**(9 Hrs)**

- 5.1 Nuclear Reactions: Q value and reaction threshold, reaction cross section, cross section and reaction rate, neutron capture cross section- variation of neutron capture cross section with energy (1/V law). Nuclear fission - fission fragments and mass distribution, fission yields, fission energy, fission cross section and threshold fission neutrons, nuclear fusion reactions and their applications.
- 5.2 Principles of counting technique: G.M. counter, proportional, ionization and scintillation counters, cloud chamber.
- 5.3 Synthesis of transuranic elements: Neptunium, Plutonium, Curium, Berkelium, Einsteinium, Mendelevium, Nobelium, Lawrencium
- 5.4 Analytical applications of radioisotopes-radiometric titrations, kinetics of exchange reactions, measurement of physical constants including diffusion constants, Radioanalysis, Neutron Activation Analysis, Prompt Gamma Neutron Activation Analysis and Neutron Absorptiometry.
- 5.5 Radiation chemistry of water and aqueous solutions. Measurement of radiation doses. Relevance of radiation chemistry in biology, organic compounds and radiation polymerization.

## CH 50 01 02 STRUCTURAL AND MOLECULAR ORGANIC CHEMISTRY

Credit: 4

Contact Lecture Hours: 72

### Objectives of the Course

To learn and apply the fundamental concepts and mechanisms of organic and photochemical reactions, stereochemistry and conformational analysis of organic compounds

#### Unit 1: Basic Concepts in Organic Chemistry (18 Hrs)

- 1.1 Review of basic concepts in organic chemistry: Bonding, hybridisation, MO picture of butadiene and allyl systems.
- 1.2 Electron displacement effects: Inductive effect, electromeric effect, resonance effect, hyperconjugation, steric effect. Bonding weaker than covalent bonds.
- 1.3 Concept of aromaticity: Delocalization of electrons - Hückel's rule, criteria for aromaticity, examples of neutral and charged aromatic systems - annulenes. NMR as a tool, carbon nanotubes and graphene
- 1.4 Mechanism of electrophilic and nucleophilic aromatic substitution reactions with examples. Arenium ion intermediates. SN1, SNAr, SRN1 and benzyne mechanisms.

#### Unit 2: Physical Organic Chemistry (9Hrs)

- 2.1 Energy profiles. Kinetic versus thermodynamic control of product formation, Hammond postulate, kinetic isotope effects with examples. Linear free energy relationships-Hammett equation, Taft equation.
- 2.2 Catalysis by acids, bases and nucleophiles with examples from acetal, cyanohydrin. Ester formation and hydrolysis reactions of esters-AAC2, AAC1, AAL1, BAC2 and BAL1 mechanisms. Hard and soft acids, bases - HSAB principle and its applications (organic reactions only)

#### Unit 3: Organic Photochemistry (9hrs)

- 3.1 Photoreactions of carbonyl compounds: Norrish reactions of ketones. Paterno-Buchi reaction. Barton (nitrite ester reaction); Di- $\pi$ -methane and Photo Fries rearrangements, photochemistry of conjugated dienes (butadiene only), photochemistry of vision.

#### Unit 4: Stereochemistry of Organic Compounds (18Hrs)

- 4.1 Stereoisomerism: Definition based on symmetry and energy criteria, configuration and conformational stereoisomers, introduction to Atropisomerism (basic idea only)

- 4.2 Center of chirality: Molecules with C, N, S based chiral centers, absolute configuration, enantiomers, racemic modifications, R and S nomenclature using Cahn-Ingold-Prelog rules, molecules with a chiral center and  $C_n$ , molecules with more than one center of chirality, definition of diastereoisomers, constitutionally symmetrical and unsymmetrical chiral molecules, erythro and threo nomenclature.
- 4.3 Axial, planar and helical chirality with examples, stereochemistry and absolute configuration of allenes, biphenyls and binaphthyls, ansa and cyclophanic compounds, spiranes, exo-cyclic alkylidenecycloalkanes.
- 4.4 Topicity and prostereoisomerism, topicity of ligands and faces as well as their nomenclature, NMR distinction of enantiotopic/diastereotopic ligands.
- 4.5 Geometrical isomerism: nomenclature, E-Z notation, methods of determination of geometrical isomers, interconversion of geometrical isomers.

#### **Unit 5: Conformational Analysis**

**(18 Hrs)**

- 5.1 Conformational descriptors :Factors affecting conformational stability of molecules, conformational analysis of substituted ethanes, cyclohexane and its derivatives, decalins, adamantane, norbornane, sucrose and lactose.
- 5.2 Conformation and reactivity of elimination (dehalogenation, dehydrohalogenation, semipinacolic deamination and pyrolytic elimination - Saytzeff and Hofmann eliminations), substitution and oxidation of 2° alcohols.
- 5.3 Chemical consequence of conformational equilibrium - Curtin Hammett principle.

## CH 50 01 03 QUANTUM CHEMISTRY AND GROUP THEORY

Credit: 4

Contact Lecture Hours: 72

### Objective of the course

Revise and update the fundamental ideas, mathematical concepts, applications of Group theory and quantum mechanics to molecular systems. The learners should be able to categorise common molecules into various point groups and apply the great orthogonality theorem to derive the character tables of various point groups.

### Unit 1 Group Theory and Applications in Chemical Bonding (36 Hrs)

- 1.1. Symmetry elements and symmetry operations.
- 1.2. Determination of point groups of molecules and ions (organic / inorganic / complex) belonging to  $C_n$ ,  $C_s$ ,  $C_i$ ,  $C_{nv}$ ,  $C_{nh}$ ,  $C_{\infty v}$ ,  $D_{nh}$ ,  $D_{\infty h}$ ,  $D_{nd}$ ,  $T_d$  and  $O_h$  point groups.
- 1.3. Symmetry in crystals: 32 crystallographic point groups (no derivation), Hermann-Mauguin symbols. Screw axis-pitch and fold of screw axis, glide planes, space groups (elementary idea only)
- 1.4. Mathematical groups: Properties, Abelian groups, cyclic groups, sub groups, similarity transformation, classes -  $C_{2v}$ ,  $C_{3v}$  and  $C_{2h}$ .
- 1.5. Group multiplication tables (GMTs) -  $C_{2v}$ ,  $C_{3v}$  and  $C_{2h}$ , isomorphic groups.
- 1.6. Matrix representation of elements like E,  $C_n$ ,  $S_n$ , I,  $\sigma$ -matrix representation of point groups like  $C_{2v}$ ,  $C_{3v}$ ,  $C_{2h}$ ,  $C_{4v}$  - trace / character, block factored matrices.
- 1.7. Reducible and irreducible representations, standard reduction formula, statement of great orthogonality theorem (GOT). Construction of character tables for  $C_{2v}$ ,  $C_{2h}$ ,  $C_{3v}$  and  $C_{4v}$ .
- 1.8. Application in chemical bonding: Projection operator, transformation properties of atomic orbitals, construction of symmetry adapted linear combination of atomic orbitals (SALCs) of  $C_{2v}$ ,  $C_{3v}$ ,  $D_{3h}$  and  $C_{2h}$  molecules.

### Unit 2 Quantum Mechanics and Applications (36Hrs)

- 2.1. Experimental foundation of quantum mechanics: Elementary ideas of black body radiation, photoelectric effect and atomic spectra. Need of quantum mechanics. Concept of matter wave, de Broglie relation, uncertainty principle and its consequences.
- 2.2. Postulates of Quantum Mechanics: State function or wave function postulate: Born interpretation of the wave function, well behaved functions, orthonormality of wave functions. Operator postulate: Operator algebra, linear and nonlinear operators, Laplacian operator, commuting and noncommuting operators, Hermitian operators

and their properties, eigen functions and eigen values of an operator. Eigen value postulate: eigen value equation, eigen functions of commuting operators. Expectation value postulate. Postulate of time-dependent Schrödinger equation, conservative systems and time-independent Schrödinger equation.

- 2.3. Translational motion: Free particle in one-dimension, particle in a one dimensional box with infinite potential walls, particle in a one-dimensional box with finite potential walls-tunneling, particle in a three dimensional box ,separation of variables, degeneracy.
- 2.4. Vibrational motion: One-dimensional harmonic oscillator (complete treatment), Hermite equation (solving by method of power series), Hermite polynomials, recursion relation, wave functions and energies-important features, harmonic oscillator model and molecular vibrations.
- 2.5. Rotational motion: Co-ordinate systems, cartesian, cylindrical polar and spherical polar coordinates and their relationships. The wave equation in spherical polar coordinates-particle on a ring, the phi equation and its solution, wave functions in the real form. Non-planar rigid rotor (or particle on a sphere), separation of variables, the phi and the theta equations and their solutions, Legendre and associated Legendre equations, Legendre and associated Legendre polynomials. Spherical harmonics (imaginary and real forms), polar diagrams of spherical harmonics.
- 2.6. Quantization of angular momentum, quantum mechanical operators corresponding to angular momenta ( $L_x$ ,  $L_y$ ,  $L_z$  and  $L^2$ ), commutation relations between these operators. Spherical harmonics as eigen functions of angular momentum operators  $L_z$  and  $L^2$ . Ladder operator method for angular momentum, space quantization.
- 2.7. Quantum Mechanics of Hydrogen-like Atoms: Potential energy of hydrogen-like systems. The wave equation in spherical polar coordinates: separation of variables-r, theta and phi equations and their solutions, wave functions and energies of hydrogen-like atoms. Orbitals: Radial functions, radial distribution functions, angular functions and their plots. Dirac's relativistic equation for hydrogen atom (Elementary idea only).
- 2.8. Spin orbitals: Construction of spin orbitals from orbitals and spin functions, spin orbitals for many electron atoms, symmetric and antisymmetric wave functions. Pauli's exclusion principle, Slater determinants.

# CH 50 01 04 THERMODYNAMICS, KINETIC THEORY AND STATISTICAL THERMODYNAMICS

**Credit: 4**

**Contact Lecture Hours: 54**

## **Objective of the course**

The learners should be able to apply principles and laws of equilibrium thermodynamics to multicomponent systems, to calculate thermodynamic properties of ideal gases and real gases using the principles and techniques of statistical thermodynamics. They should be familiar with the properties and theories of gases.

## **Unit 1: Classical Thermodynamics**

**(18 Hrs)**

- 1.1 Mathematical foundations for thermodynamics-variables of thermodynamics, extensive and intensive quantities, equation for total differential, conversion formulas, exact differentials-general formulation, reciprocity characteristics, homogeneous functions, Euler's theorem.(Non-evaluative)
- 1.2 Thermodynamic equations of state. Maxwell relations and significance, irreversible processes - Clausius inequality.
- 1.3 Free energy, thermodynamic equilibria and free energy functions, temperature dependence of free energy - Gibbs Helmholtz equation, applications of Gibbs Helmholtz equation.
- 1.4 Partial molar quantities, chemical potential and Gibbs-Duhem equations, variation of chemical potential with temperature and pressure, determination of partial molar volume and enthalpy.
- 1.5 Fugacity, relation between fugacity and pressure, determination of fugacity of a real gas, variation of fugacity with temperature and pressure. Activity, dependence of activity on temperature and pressure.
- 1.6 Thermodynamics of mixing, Gibbs-Duhem-Margules equation, applications of Gibbs-Duhem- Margules equation- Konovalov's first and second laws, excess thermodynamic functions-free energy, enthalpy, entropy and volume, determination of excess enthalpy and volume.
- 1.7 Chemical affinity and thermodynamic functions, effect of temperature and pressure on chemical equilibrium- Vant Hoff reaction isochore and isotherm.
- 1.8 Third law of thermodynamics, Nernst heat theorem, determination of absolute entropies using third law.
- 1.9 Three component systems-graphical representation. Solid-liquid equilibria, ternary solutions with common ions, hydrate formation, compound formation. Liquid-liquid

equilibria-one pair of partially miscible liquids, two pairs of partially miscible liquids, three pairs of partially miscible liquids.

## **Unit 2: Kinetic Theory of Gases**

**(9 Hrs)**

2.1 Derivation of Maxwell's law of distribution of velocities, graphical representation, experimental verification of the law, most probable velocity, derivation of average, RMS and most probable velocities, collision diameter, collision frequency in a single gas and in a mixture of two gases, mean free path, frequency of collision, effusion, the rate of effusion, time dependence of pressure of an effusing gas, the law of corresponding states, transport properties of gases.

## **Unit 3: Statistical Thermodynamics**

**(27Hrs)**

- 3.1 Brief history about the macroscopic and microscopic approach in science, permutation, probability, Stirling's approximation, macrostates and microstates, equal-a-priori principle and thermodynamic probability, phase-space, ensemble, types of ensembles.
- 3.2 Boltzmann distribution law, partition function and its physical significance, relation between molecular partition function and molar partition function, distinguishable and indistinguishable particles, partition function and thermodynamic functions, separation of partition function-translational, rotational, vibrational, and electronic partition functions, partition function for hydrogen. Thermal de-Broglie wavelength
- 3.3 Calculation of thermodynamic functions and equilibrium constants, thermodynamic probability and entropy, Sakur-Tetrode equation, statistical formulation of third law of thermodynamics, residual entropy, heat capacity of gases - classical and quantum theories.
- 3.4 Need for quantum statistics, Bosons and Fermions, Bose-Einstein statistics:, Bose-Einstein distribution law, Bose-Einstein condensation, first order and higher order phase transitions, liquid helium, Fermi- Dirac statistics:, Fermi- Dirac distribution law, application in electron gas, thermionic emission. Comparison of three statistics.
- 3.5 Heat capacity of solids- the vibrational properties of solids, Einstein's theory and its limitations, Debye theory and its limitations.

## SEMESTER 2

### CH 50 02 01 COORDINATION CHEMISTRY

**Credit: 4**

**Contact Lecture Hours: 72**

#### Objective of the course

The student shall acquire a foundation of chemistry of sufficient breadth and depth of co-ordination compounds which enable them to understand and apply their knowledge

#### Unit 1: Structural Aspects and Bonding

**(18 Hrs)**

- 1.1 Classification of complexes based on coordination numbers and possible geometries, sigma and pi bonding ligands such as CO, NO, CN<sup>-</sup>, R<sub>3</sub>P, and Ar<sub>3</sub>P. Stability of complexes, thermodynamic aspects of complex formation-Irving William order of stability, chelate effect.
- 1.2 Splitting of d orbitals in octahedral, tetrahedral, square planar, square pyramidal and trigonal bipyramidal fields, LFSE, Dq values, Jahn Teller (JT) effect, theoretical failure of crystal field theory, evidence of covalency in the metal-ligand bond, nephelauxetic effect, ligand field theory, molecular orbital theory- M.O energy level diagrams for octahedral and tetrahedral complexes without and with  $\pi$ -bonding, experimental evidences for pi-bonding.

#### Unit 2: Spectral and Magnetic Properties of Metal Complexes

**(18 Hrs)**

- 2.1 Electronic Spectra of complexes: Term symbols of d<sup>n</sup> system, Racah parameters, splitting of terms in weak and strong octahedral and tetrahedral fields, correlation diagrams for d<sup>1</sup> and d<sup>9</sup> ions in octahedral and tetrahedral fields (qualitative approach), d-d transitions, selection rules for electronic transitions-effect of spin orbit coupling and vibronic coupling.
- 2.2 Interpretation of electronic spectra of complexes: Orgel diagrams and demerits, TanabeSugano diagrams, calculation of Dq, B and  $\beta$  (Nephelauxetic ratio) values, spectra of complexes with lower symmetries, charge transfer spectra, luminescence spectra.
- 2.3 Magnetic properties of complexes-paramagnetic and diamagnetic complexes, molar susceptibility, Gouy method for the determination of magnetic moment of complexes, spin only magnetic moment. Temperature dependence of magnetism- Curie's law, Curie-Weiss law, temperature independent paramagnetism (TIP), spin state cross over, antiferromagnetism-inter and intra molecular interaction, anomalous magnetic moments.

### **Unit 3: Kinetics and Mechanism of Reactions in Metal Complexes (18 Hrs)**

- 3.1 Thermodynamic and kinetic stability, kinetics and mechanism of nucleophilic substitution reactions in square planar complexes- trans effect-theory and applications, effect of entering ligand, effect of leaving group and effect of ligands already present on reaction rate, effect of solvent and reaction pathways, substitution in tetrahedral and five-coordinate complexes.
- 3.2 Kinetics and mechanism of octahedral substitution- water exchange, dissociative and associative mechanisms, base hydrolysis, racemization reactions, solvolytic reactions (acidic and basic). Replacement reactions involving multidentate ligands- formation of chelates, effect of  $H^+$  on the rates of substitution of chelate complexes, metal ion assisted and ligand assisted dechelation.
- 3.3 Electron transfer reactions: Outer sphere mechanism-Marcus theory, inner sphere mechanism-Taube mechanism, mixed outer and inner sphere reactions, two electron transfer and intramolecular electron transfer.

### **Unit 4: Stereochemistry of Coordination Compounds (9 Hrs)**

- 4.1 Geometrical and optical isomerism in octahedral complexes, resolution of optically active complexes, determination of absolute configuration of complexes by ORD and circular dichroism, stereoselectivity and conformation of chelate rings, asymmetric synthesis catalyzed by coordination compounds,
- 4.2 Linkage isomerism: Electronic and steric factors affecting linkage isomerism, symbiosis-hard and soft ligands, Prussian blue and related structures, Macrocycles-crown ethers.

### **Unit 5: Coordination Chemistry of Lanthanoids and Actinoids (9 Hrs)**

- 5.1 Term symbols for lanthanide ions, inorganic compounds and coordination complexes of the lanthanoids upto coordination No.12, electronic spectra and magnetic properties of lanthanoid complexes, organometallic complexes of the lanthanoids-  $\sigma$ -bonded complexes, cyclopentadienyl complexes, organolanthanoid complexes as catalysts.
- 5.2 General characteristics of actinoids-difference between 4f and 5f orbitals, coordination complexes of the actinoids- sandwich complexes, coordination complexes and organometallic compounds of thorium and uranium, comparative account of coordination chemistry of lanthanoids and actinoids with special reference to electronic spectra and magnetic properties.

## CH 50 02 02      ORGANIC REACTION MECHANISMS

Credit: 4

Contact Lecture Hours: 72

### Objective of the course

To learn and understand the involvement of reactive intermediates, their structure and reactivity through various organic reactions, the orbital interactions (Woodward Hoffmann rules) in concerted reactions and apply knowledge for solving problems.

### Unit 1: Review of Organic Reaction Mechanisms (9 Hrs)

- 1.1 Review of organic reaction mechanisms with special reference to nucleophilic and electrophilic substitution at aliphatic carbon ( $SN_1$ ,  $SN_2$ ,  $SN_i$ ,  $SE_1$ ,  $SE_2$ ), elimination ( $E_1$  and  $E_2$ ) and addition reactions (regioselectivity: Markovnikov's addition- carbocation mechanism, anti-Markovnikov's addition-radical mechanism). Elimination vs substitution.
- 1.2 A comprehensive study on the effect of substrate, reagent, leaving group, solvent and neighbouring group on nucleophilic substitution( $SN_2$  and  $SN_1$ ) and elimination ( $E_1$  and  $E_2$ ) reactions.

### Unit 2: Chemistry of Carbanions (9 Hrs)

- 2.1 Formation, structure and stability of carbanions; Reactions of carbanions: C-X bond (X = C, O, N) formations through the intermediary of carbanions. Chemistry of enolates and enamines. Kinetic and Thermodynamic enolates- lithium and boron enolates in aldol and Michael reactions, alkylation and acylation of enolates.
- 2.2 Nucleophilic additions to carbonyls groups: Name reactions under carbanion chemistry-mechanism of Claisen, Dieckmann, Knoevenagel, Stobbe, Darzen and acyloin condensations, Shapiro reaction and Julia elimination. Favorski rearrangement.
- 2.3 Ylids: chemistry of phosphorous and sulphurylids - Wittig and related reactions, Peterson olefination.

### Unit 3: Chemistry of Carbocations (9 Hrs)

- 3.1 Formation, structure and stability of carbocations. Classical and non-classical carbocations.
- 3.2 C-X bond (X = C, O, N) formations through the intermediary of carbocations. Molecular rearrangements including Wagner-Meerwein, Pinacol-pinacolone, Semi-pinacol, Dienone-phenol and Benzilic acid rearrangements, Noyori annulation, Prins reaction.
- 3.3 C-C bond formation involving carbocations: Oxymercuration, Halolactonisation.

**Unit 4: Carbenes, Carbenoids, Nitrenes and Arynes (9 Hrs)**

- 4.1 Structure of carbenes (singlet and triplet), generation of carbenes, addition and insertion reactions.
- 4.2 Reactions of carbenes such as Wolff rearrangement, Reimer-Tiemann reaction. Reactions of ylides by carbenoid decomposition
- 4.3 Structure, generation and reactions of nitrene and related electron deficient nitrene intermediates.
- 4.4 Hoffmann, Curtius, Lossen, Schmidt and Beckmann rearrangement reactions.
- 4.5 Arynes: Generation, structure, stability and reactions. Orientation effect - amination of haloarenes.

**Unit 5: Radical Reactions (9 Hrs)**

- 5.1 Generation of radical intermediates and its (a) addition to alkenes, alkynes (inter and intramolecular) for C-C bond formation - Baldwin's rules (b) fragmentation and rearrangements - Hydroperoxide: formation, rearrangement and reactions. Autooxidation.
- 5.2 Name reactions involving radical intermediates: Barton deoxygenation and decarboxylation, McMurry coupling.

**Unit 6: Chemistry of Carbonyl Compounds (9 Hrs)**

- 6.1 Reactions of carbonyl compounds: Oxidation, reduction (Clemmensen and Wolf-Kishner), addition (addition of cyanide, ammonia, alcohol) reactions, Aldol condensation, Cannizzaro reaction, Addition of Grignard reagent. Structure and reactions of  $\alpha$ ,  $\beta$ -unsaturated carbonyl compounds involving electrophilic and nucleophilic addition - Michael addition, Mannich reaction, Robinson annulation.

**Unit 7: Concerted Reactions (18 Hrs)**

- 7.1 Classification: Electrocyclic, sigmatropic, cycloaddition, chelotropic, ene and diotropic reactions. Woodward Hoffmann rules - Frontier orbital and orbital symmetry correlation approaches - PMO method (for electrocyclic and cycloaddition reactions only).
- 7.2 Highlighting pericyclic reactions in organic synthesis such as Claisen, Cope, Wittig, Mislow-Evans and Sommelet-Hauser rearrangements. Diels-Alder and Ene reactions (with stereochemical aspects), dipolar cycloaddition (introductory).
- 7.3 Unimolecular pyrolytic elimination reactions: Chelotropic elimination, decomposition of cyclic azo compounds,  $\beta$ -eliminations involving cyclic transition states such as N-oxides (Cope reaction), Acetates and Xanthates (Chugaev reaction).

#### 7.4 Problems based on the above topics

# CH 50 02 03      CHEMICAL BONDING AND COMPUTATIONAL CHEMISTRY

**Credit: 3**

**Contact Lecture Hours: 72**

## **Ojective of the course**

The learners should be able to apply, analyze and evaluate group theoretical concepts in spectroscopy, extent the ideas of quantum mechanics from one electron system to many electron systems and various theories of chemical bonding.

### **Unit 1: Application of Group Theory in Spectroscopy (18hrs)**

- 1.1. Vibrational mode analysis using group theory taking H<sub>2</sub>O, NH<sub>3</sub> and trans-N<sub>2</sub>F<sub>2</sub> as examples using symmetry coordinates and internal coordinates method, prediction of IR and Raman activity, -rule of mutual exclusion, -redundant modes, out of plane modes.
- 1.2. Application in uv-visible spectroscopy, selection rules, orbital selection rules, transitions between non-degenerate states, prediction of electronic transitions in C<sub>2v</sub>, C<sub>3v</sub>, C<sub>4v</sub>, C<sub>2h</sub> and C<sub>4h</sub> using direct product terms, spin selection rules, relaxation in selection rules and distortion.
- 1.3. Application in hybridization, determination of hybridization and hybrid functions in CH<sub>4</sub>, BF<sub>3</sub> and PCl<sub>5</sub>
- 1.4. Group theory and optical activity (brief study)

### **Unit 2 : Approximation Methods in Quantum Mechanics (18 Hrs)**

- 2.1 Many-body problem and the need of approximation methods, independent particle model. Variation method: Variation theorem with proof, illustration of variation theorem using the trial function  $x(a-x)$  for particle in a 1D-box and using the trial function  $e^{-\alpha r}$  for the hydrogen atom, variation treatment for the ground state of helium atom.
- 2.2 Perturbation method, time-independent perturbation method (non-degenerate case only), first order correction to energy and wave function, illustration by application to particle in a 1D-box with slanted bottom, perturbation treatment of the ground state of the helium atom. Qualitative idea of Hellmann-Feynman theorem.
- 2.3 Hartree-Fock method, multi-electron atoms. Hartree-Fock equations (no derivation). The Fock operator, core hamiltonian, coulomb operator and exchange operator. Qualitative treatment of Hartree-Fock Self-Consistent Field (HFSCF) method. Roothan's concept of basis functions, Slater type orbitals (STO) and Gaussian type orbitals (GTO), sketches of STO and GTO.

### Unit 3: Chemical Bonding

(18 Hrs)

- 3.1 Schrödinger equation for molecules. Born-Oppenheimer approximation, valence bond (VB) theory, VB theory of H<sub>2</sub> molecule, singlet and triplet state functions (spin orbitals) of H<sub>2</sub>.
- 3.2 Molecular Orbital (MO) theory, MO theory of H<sub>2</sub><sup>+</sup> ion, MO theory of H<sub>2</sub> molecule, MO treatment of homonuclear diatomic molecules Li<sub>2</sub>, Be<sub>2</sub>, N<sub>2</sub>, O<sub>2</sub> and F<sub>2</sub> and hetero nuclear diatomic molecules LiH, CO, NO and HF, bond order. Correlation diagrams, non-crossing rule, spectroscopic term symbols for diatomic molecules, comparison of MO and VB theories.
- 3.3 Hybridization, quantum mechanical treatment of sp, sp<sup>2</sup> and sp<sup>3</sup> hybridisation. Semiempirical MO treatment of planar conjugated molecules, Hückel Molecular Orbital (HMO) theory of ethene, allyl systems, butadiene and benzene. Calculation of charge distributions, bond orders and free valency.

### Unit 4: Computational Quantum Chemistry

(18 Hrs)

- 4.1 Introduction and scope of computational chemistry, potential energy surface, conformational search, global minimum, local minima, saddle points.
- 4.2 Ab initio methods: A review of Hartree-Fock method, self-consistent field (SCF) procedure. Roothaan concept basis functions. Basis sets and its classification: Slater type and Gaussian type basis sets, minimal basis set, Pople style basis sets. Hartree-Fock limit. Post Hartree-Fock methods - introduction to Møller Plesset perturbation theory, configuration interaction, coupled cluster and semi empirical methods.
- 4.3 Introduction to Density Functional Theory (DFT) methods: Hohenberg-Kohn theorems, Kohn-Sham orbitals, exchange correlation functional, local density approximation, generalized gradient approximation, hybrid functionals (only the basic principles and terms need to be introduced).
- 4.4 Comparison of ab initio, semi empirical and DFT methods.
- 4.5 Molecular geometry input: Cartesian coordinates and internal coordinates, Z matrix, Z-matrix of single atom, diatomic molecule, non-linear triatomic molecule, linear triatomic molecule, polyatomic molecules like ammonia, methane and ethane. General format of GAMESS / Firefly input file, single point energy calculation, geometry optimization, constrained optimization and frequency calculation. Koopmans' theorem.
- 4.6 Features of molecular mechanics force field-bond stretching, angle bending, torsional terms, non-bonded interactions and electrostatic interactions. Commonly used force fields- AMBER and CHARMM.

## Softwares

### A) Molecular Mechanics:

Arguslab, Tinker, NAMD, DL-POLY, CHARMM, AMBER

### B) Ab initio, semiempirical and dft:

1. Firefly / PC GAMESS available from <http://classic.chem.msu.su/gran/games/>

2. WINGAMESS available from <http://www.msg.ameslab.gov/games/>

### C) Graphical User Interface (GUI):

1. Gabedit available from <http://gabedit.sourceforge.net/>

2. wxMacMolPlt available from <http://www.scl.ameslab.gov/MacMolPlt>

## CH 50 02 04      MOLECULAR SPECTROSCOPY

Credit: 3

Contact Lecture Hours: 54

### Objective of the course

To learn basic principles and theory of microwave, NMR, IR, Raman, UV-Vis spectroscopy.

### Unit 1: Foundations of Spectroscopic Techniques (3 Hrs)

Regions of the electromagnetic radiation, origin of spectrum, intensity of absorption, signal to noise ratio, natural line width. Doppler broadening, Lamb dip spectrum, Born Oppenheimer approximation.

### Unit 2: Microwave Spectroscopy (6 Hrs)

- 2.1 Principal moments of inertia and classification (linear, symmetric tops, spherical tops and asymmetric tops), selection rules, intensity of rotational lines, relative population of energy levels, derivation of  $J_{\max}$ , effect of isotopic substitution, calculation of intermolecular distance, spectrum of non rigid rotors.
- 2.2 Rotational spectra of polyatomic molecules, linear and symmetric top molecules. Stark effect and its application, nuclear spin and electron spin interaction, chemical analysis by microwave spectroscopy.

### Unit 3: Infrared and Raman Spectroscopy (9 Hrs)

- 3.1 Morse potential energy diagram, fundamental vibrations, overtones and hot bands, determination of force constants, diatomic vibrating rotator, break down of the Born-Oppenheimer approximation, effect of nuclear spin.
- 3.2 Vibrational spectra of polyatomic molecules, normal modes of vibrations, combination and difference bands, Fermi resonance. FT technique, introduction to FTIR spectroscopy. Instrumentation of FTIR
- 3.3 Scattering of light, polarizability and classical theory of Raman spectrum, rotational and vibrational Raman spectrum, complementarities of Raman and IR spectra, mutual exclusion principle, polarized and depolarized Raman lines, resonance Raman scattering and resonance fluorescence.

### Unit 4: Electronic Spectroscopy (9 Hrs)

- 4.1 Term symbols of diatomic molecules, electronic spectra of diatomic molecules, selection rules, vibrational coarse structure and rotational fine structure of electronic spectrum. Franck-Condon principle, predissociation, calculation of heat of dissociation, Birge and Sponer method.

- 4.2 Electronic spectra of polyatomic molecules, spectra of transitions localized in a bond or group, free electron model. Different types of lasers-solid state lasers, continuous wave lasers, gas lasers and chemical laser, frequency doubling, applications of lasers.

**Unit 5: Nuclear Magnetic Resonance Spectroscopy (18 Hrs)**

- 5.1 Theory of NMR Spectroscopy: Interaction between nuclear spin and applied magnetic field, important magnetically active nuclei. Nuclear energy levels, population of energy levels, Larmor precession, relaxation methods. Chemical shift and its representation-  $\delta$  scale of PMR and CMR. Spin-spin coupling: Theory and illustration with AX system.
- 5.2 Fourier Transformation (FT) NMR Spectroscopy: Instrumentation of NMR technique, magnets, probe and probe tuning, Creating NMR signals, effect of pulses, rotating frame reference, FID, FT technique, data acquisition and storage. Pulse sequences- Pulse width, spins and magnetisation vector.
- 5.3 Solid state NMR-Applications. Magic Angle Spinning(MAS).

**Unit 6: Other Magnetic Resonance Techniques (9 Hrs)**

- 6.1 EPR Spectroscopy: Electron spin in molecules, interaction with magnetic field, g factor, factors affecting g values, determination of g values ( $g_{\parallel}$  and  $g_{\perp}$ ), fine structure and hyperfine structure, Kramers' degeneracy, McConnell equation.
- 6.2 Theory and important applications of NQR Spectroscopy.
- 6.3 Mossbauer Spectroscopy: Principle, Doppler effect, recording of spectrum, chemical shift, factors determining chemical shift, application to metal complexes.

## SEMESTERS 1 AND 2

### CH 50 02 05 INORGANIC CHEMISTRY PRACTICAL-1

**Credit: 3**

**Contact Lab Hours: 54+54=108**

#### **Objective of the Course**

The learners should be able to apply the principles of qualitative and quantitative analytical techniques in inorganic chemistry for identification of ions and preparation and characterization of inorganic complexes

#### **PART I**

Separation and identification of a mixture of four cations (a mixture of two familiar ions such as  $\text{Ag}^+$ ,  $\text{Hg}^{2+}$ ,  $\text{Pb}^{2+}$ ,  $\text{Cu}^{2+}$ ,  $\text{Bi}^{2+}$ ,  $\text{Cd}^{2+}$ ,  $\text{As}^{3+}$ ,  $\text{Sn}^{2+}$ ,  $\text{Sb}^{3+}$ ,  $\text{Fe}^{2+}$ ,  $\text{Fe}^{3+}$ ,  $\text{Al}^{3+}$ ,  $\text{Cr}^{3+}$ ,  $\text{Zn}^{2+}$ ,  $\text{Mn}^{2+}$ ,  $\text{Co}^{2+}$ ,  $\text{Ni}^{2+}$ ,  $\text{Ca}^{2+}$ ,  $\text{Sr}^{2+}$ ,  $\text{Ba}^{2+}$ ,  $\text{Mg}^{2+}$ ,  $\text{Li}^+$ ,  $\text{Na}^+$ ,  $\text{K}^+$  and  $\text{NH}_4^+$  and two less familiar metal ions such as Tl, W, Se, Mo, Ce, Th, Ti, Zr, V, U and Li). Anions which need elimination not to be given. Minimum eight mixtures to be given.

#### **PART II**

Colorimetric estimation of Fe, Cu, Ni, Mn, Cr,  $\text{NH}_4^+$ , nitrate and phosphate ions.

#### **PART III**

Preparation and characterization complexes using IR, NMR and electronic spectra.

- (a) Tris (thiourea)copper(I) complex
- (b) Potassium tris (oxalate) aluminate (III).
- (c) Hexammine cobalt (III) chloride.
- (d) Tetrammine copper (II) sulphate.
- (e) Schiff base complexes of various divalent metal ions.
- (f) Bis(dimethylglyoximato)nickel(II)
- (g) Prussian blue

## CH 50 02 06 ORGANIC CHEMISTRY PRACTICAL-1

**Credit: 3**

**Contact Lab Hours:54+54=108**

### Objective of the Course

The learners should be able to apply class room learning separation and purification of organic compounds and binary mixtures. They should be able to use the computational tools to draw the reaction schemes and spectral data to various organic reactions

### PART I

General methods of separation and purification of organic compounds such as:

1. Solvent Extraction
2. Soxhlet Extraction
3. Fractional crystallization
4. TLC and Paper Chromatography
5. Column Chromatography
6. Membrane Dialysis

### PART II

1. Separation of Organic binary mixtures by chemical/solvent separation methods
2. Quantitative separation of organic mixtures by column chromatography – Purity assessment of the components by TLC.

### PART III

Drawing the reaction schemes (Based on Semester 1 and 2 theory) by ChemDraw, Symyx Draw and ChemsSketch. Draw the structures and generate the IR and NMR spectra of the substrates and products in the following reactions:

1. Condensation
  - (a) Dieckmann condensation
  - (b) Claisen condensation
  - (c) Darzen condensation
  - (d) Aldol condensation
2. Oxidation / Reduction
  - (a) Ozonolysis
  - (b) Baeyer Villiger oxidation
  - (c) Cannizaro reaction
  - (d) Clemmenson reduction
3. Rearrangement
  - (a) Benzilic acid rearrangement
  - (b) Pinacol – Pinacolone rearrangement
  - (c) Dienone – Phenol rearrangement
  - (d) Wagner – Meerwein rearrangement

4. Pericyclic reaction
  - (a) Diels – Alder reaction
  - (b) Cope rearrangement

## CH 50 02 07 PHYSICAL CHEMISTRY PRACTICAL-1.

**Credit: 3**

**Contact Lab Hours: 72+72 =144**

### Objective of the Course

The learners should be able to apply the conceptual understanding acquired from the theory classes

**(One question each from both parts A and B will be asked for the examination)**

### PART A

#### I. Adsorption

Verification of Freundlich and Langmuir adsorption isotherm Charcoal Acetic acid or Charcoal-Oxalic acid system

Determination of concentration of given acid using the isotherm

#### II. Phase diagrams

Construction of phase diagram of simple eutectics

Effect of KCl/Succinic acid on Critical Solution Temperature of phenol water system

Construction of phase diagram of three component system with one pair of partially miscible liquids

#### III. Distribution law

Distribution coefficient of Iodine between an organic solvent and water

Determination of the equilibrium constant of the reaction  $KI + I_2 \rightarrow KI_3$

Determination of unknown concentration of KI

#### IV. Surface tension

##### 1. Determination of the surface tension of a liquid by

(a) Capillary rise method

(b) Drop number method

(c) Drop weight method

##### 2. Determination of Parachor values

##### 3. Determination of the composition of two liquids by surface tension measurements

4. Determination of CMC of surfactants by surface tension measurements
- V. Determination of heat of solution from solubility measurements

## **PART B**

### Computational chemistry experiments

- VI. Experiments illustrating the capabilities of modern open source/ free computational chemistry packages in computing.
  - (a) Single point energy
  - (b) Geometry optimization
  - (c) Vibrational frequencies
  - (d) Population analysis
  - (e) Conformational analysis of ethane, transition state search
  - (f) Molecular orbitals, ionisation energy, electron affinity
  - (g) Dipolemoment, freevalence, bond order
  - (h) Determination of inversion barrier of simple molecules like  $\text{NH}_3$ ,  $\text{H}_2\text{O}$ ,  $\text{H}_2\text{O}_2$
  - (I) Determination of Z-matrices /Cartesian coordinates of furan, thiophene, pyrrole and benzene using structure drawing programs like Chems sketch and wwMacMolPlt.

## SEMESTER 3

### CH 50 03 01      STRUCTURAL INORGANIC CHEMISTRY

**Credit: 4**

**Contact Lecture Hours: 72**

#### **Objective of the Course**

The students must acquire basic information about the imperfections of solids, electrical and magnetic properties of solids and properties of inorganic chains, rings, cages and clusters. They should have an awareness about organometallic polymers and magnetic nanoparticles.

#### **Unit 1: Solid State Chemistry**

**(18 Hrs)**

- 1.1 Structure of solids: Imperfections in solids- line defects and plane defects. Structure of the following compounds - Zinc blende, Wurtzite, Rutile, fluorite, antiferite, Nickel Arsenide, Perovskite and Ilmenite. Spinel, inverse spinel structures.
- 1.2 Solid state reactions, diffusion coefficient, mechanisms, vacancy diffusion. Thermal decomposition of solid: Type I reactions, Type II reactions.
- 1.3 Phase transition in solids: Classification of phase transitions, first and second order phase transitions, martensitic transformations, order-disorder transitions and spinodal decomposition, kinetics of phase transitions, sintering, growing single crystals-crystal growth from solution, growth from melt and vapour deposition technique.

#### **Unit 2: Electrical, Magnetic and Optical Properties**

**(18 Hrs)**

- 2.1 Free electron theory of solids. Band theory of solids: Applications to Transition metal compounds and compounds like NaCl, MgO and fullerenes. Energy bands-conductors and non-conductors, Mechanism of intrinsic and extrinsic semiconductors. Mobility of charge carriers- Hall Effect (derivation required). Piezo electricity, pyroelectricity and ferroelectricity- hysteresis.
- 2.2 Magnetic properties of transition metal oxides, garnets, spinels, ilmenites and perovskites, magnetoplumbites. Photoconductivity, photovoltaic effects, luminescence, applications of optical properties-phosphors, solid state lasers and solar cells.
- 2.4 Conductivity of pure metals. Super conductivity-Type I and Type II superconductors, Meissner effect, BCS theory of superconductivity (derivation not required)-Cooper pairs. High temperature superconductors, superconducting cuprates - YBaCu oxide system. Josephson's Junction, conventional superconductors, organic superconductors, fullerenes, carbon nanotubes and graphenes.

### **Unit 3: Inorganic Chains and Rings (9 Hrs)**

- 3.1 Chains: Catenation, heterocatenation, silicones. Zeolites: Synthesis, structure and applications, isopoly acids of vanadium, molybdenum and tungsten, heteropoly acids of Mo and W, polythiazil-one dimensional conductors. Infinite metal chains
- 3.2 Rings, topological approach to boron hydrides, styx numbers. Heterocyclic inorganic ring systems: Structure and bonding in phosphorous-sulphur and sulphur-nitrogen compounds. Homocyclic inorganic ring systems: Structure and bonding in sulphur, selenium and phosphorous compounds.

### **Unit 4: Inorganic Cages and Clusters (9 Hrs)**

- 4.1 Synthesis, structure and bonding of cage like structures of phosphorous. Boron cage Aluminium, indium and gallium clusters, cages and clusters of germanium, tin and lead, cages and clusters of tellurium, Mercuride clusters in amalgams. Medical applications of boron clusters- nucleic acid precursors, DNA binders, application of  $C_{2}B_{10}$  for Drug Design, Nuclear receptor ligands bearing  $C_{2}B_{10}$  cages.

### **Unit 5: Organometallic Polymers (9 Hrs)**

- 5.1 Polymers with organometallic moieties as pendant groups, polymers with organometallic moieties in the main chain, condensation polymers based on ferrocene and on rigid rod polyynes, poly(ferrocenylsilane)s, applications of Poly(ferrocenylsilane)s and related polymers, applications of rigid-rod polyynes, polygermanes and polystannanes, polymers prepared by ring opening polymerization, organometallic dendrimers.

### **Unit 6: Magnetic Nanoparticles and Synthesis of Solids (9 Hrs)**

- 6.1 Synthesis of Solids: Nucleation, growth, epitaxy and topotaxy, methods for the synthesis of  $MgAl_2O_4$ , silica glass, indium tin oxide and their coatings, zeolites and alumina based abrasives, hydrothermal synthesis, intercalation and deintercalation, preparation of thin films, electrochemical methods, chemical vapour deposition. Synthesis of amorphous silica and diamond films, sputtering and laser ablation.
- 6.2 Magnetic nanoparticles, superparamagnetism and thin films, applications of magnetic nanoparticles- data storage, Magnetic Resonance Imaging (MRI) and Contrast Enhancement using magnetic nanoparticles, biomedical applications of magnetic nanoparticles.

## CH 50 03 02 ORGANIC SYNTHESSES

Credit : 4

Contact Lecture Hours: 72

### Objective of the course

To understand the various organic reactions and reagents as tools for the synthesis of organic compounds. To learn the principles of protecting group chemistry and retrosynthetic approach towards organic synthesis.

### Unit 1: Organic Synthesis via Oxidation and Reduction (18 Hrs)

- 1.1 Survey of organic reactions with special reference to oxidation and reduction. Metal based and non-metal based oxidations of (a) alcohols to carbonyls [(Chromium-John's oxidation, Collin's oxidation, Sarrett oxidation), Manganese, aluminium and DMSO (Swern oxidation, Moffatt-Pfitzner oxidation, Kornblum oxidation, Corey-Kim oxidation)] based reagents (b) alkenes to epoxides (peroxides/peracids based)- Sharpless asymmetric epoxidation, Jacobsen epoxidation, Shi epoxidation (c) alkenes to diols (Manganese and Osmium based)- Prevost reaction and Woodward modification (d) alkenes to carbonyls with bond cleavage (Manganese based, ozonolysis) (e) alkenes to alcohols/carbonyls without bond cleavage-hydroboration-oxidation, Wacker oxidation, selenium based allylic oxidation (f) ketones to ester/lactones- Baeyer-Villiger oxidation.
- 1.2 (a) Catalytic hydrogenation (Heterogeneous: Palladium/Platinum/Rhodium and Nickel. Homogeneous: Wilkinson). (b) Metal based reductions- Birch reduction, pinacol formation, acyloin formation (c) Enzymatic reduction using Baker's yeast.

### Unit 2: Modern Synthetic Methods (18Hrs)

- 2.1 Baylis-Hillman reaction, Henry reaction, Nef reaction, Kulinkovich reaction, Ritter reaction, Sakurai reaction, Tishchenko reaction. Brook rearrangement. Tebbe olefination. Metal mediated C-C and C-X coupling reactions: Heck, Stille, Suzuki-Miyaura, Negishi, Sonogashira, Nozaki-Hiyama-Kishi, Buchwald-Hartwig, Ullmann and Glaser coupling reactions. Click reactions (Huisgen 1,3-dipolar addition).
- 2.2 Multicomponent reactions-Ugi reaction, Passerini reaction and Biginelli reaction.

### Unit 3: Synthetic Reagents (9Hrs)

- 3.1. Hydride transfer reagents from Group III and Group IV in reductions -  $\text{LiAlH}_4$ , DIBAL-H, Red-Al,  $\text{NaBH}_4$  and  $\text{NaCNBH}_3$ , selectrides, trialkylsilanes and trialkyl stannane. Aluminum isopropoxide (oxidation and reduction). Reagents such as NBS, DDQ and DCC. Gilman reagent. DMAP-Borane, PCC, DEAD (Mitsunobu reaction).

**Unit 4: Construction of Carbocyclic and Heterocyclic Ring Systems (9 Hrs)**

- 4.1 Synthesis of four, five and six-membered rings, photochemical approaches for the synthesis of four membered rings-oxetanes and cyclobutanes, ketene cycloaddition (inter and intra molecular), Pauson-Khand reaction, Volhardt reaction, Bergman cyclization, Nazarovcyclization, cation-olefin cyclization and radical-olefin cyclization.
- 4.2 Inter-conversion of ring systems (contraction and expansion)-Demjenov reaction, Reformatsky reaction. Construction of macrocyclic rings-ring closing metathesis (Grubb's catalyst).
- 4.3 Formation of heterocyclic rings: 5-membered ring heterocyclic compounds with one or more than one hetero atom like N, S or O - pyrrole, furan, thiophene, imidazole, thiazole and oxazole.

**Unit 5: Protecting Group Chemistry (9 Hrs)**

- 5.1 Protection and deprotection of hydroxy, carboxyl, carbonyl, and amino groups. Chemo and regio selective protection and deprotection.
- 5.2 Protection and deprotection in peptide synthesis: common protecting groups used in peptide synthesis, protecting groups used in solution phase and solid phase peptide synthesis (SPPS).

**Unit 6: Retrosynthetic Analysis (9 Hrs)**

- 6.1 Basic principles and terminology of retrosynthesis: synthesis of aromatic compounds, one group and two group C-X disconnections; one group C-C and two group C-C disconnections.
- 6.2 Amine and alkene synthesis: important strategies of retrosynthesis, functional group transposition, important functional group interconversions. Retrosynthesis of D-luciferin. Functional equivalents and reactivity-Umpolung reaction (Ireland-Claisen rearrangement).

# CH 01 03 03      CHEMICAL KINETICS, SURFACE CHEMISTRY AND CRYSTALLOGRAPHY

**Credit: 4**

**Contact Lecture Hours: 72**

## **Objective of the Course**

To recognise the fundamental theories of reaction rates, mechanism of chain reactions, different types of surfaces, application of various isotherms in surface catalysed reactions, symmetries of different crystal point groups and types and examples of liquid crystals

## **Unit 1: Chemical Kinetics**

**(27 Hrs)**

- 1.1 Theories of reaction rates: Collision theory, kinetic theory of collisions, steric factor, potential energy surfaces. Conventional transition state theory, thermodynamic formulation of the reaction rate-Eyring equation. Comparison of the two theories. Significance of  $\Delta G^\ddagger$ ,  $\Delta H^\ddagger$  and  $\Delta S^\ddagger$ , volume of activation. Effect of pressure and volume on velocity of gas reactions.
- 1.2 Unimolecular reactions: Lindemann- Hinshelwood mechanism, qualitative idea of RRKM theory.
- 1.3 Chain reactions: Chain initiation processes, steady state treatment, kinetics of  $H_2-Cl_2$  and  $H_2-Br_2$  reactions, Rice-Herzfeld mechanism for decomposition of ethane and acetaldehyde, Goldfinger-Letort-Niclausen rules, branching chains, Semenov-Hinshelwood mechanism of branching chains, upper and lower explosion limits, the  $H_2-O_2$  reaction, kinetics of step growth, free radical, cationic and anionic polymerization reactions.
- 1.4 Fast reactions: Relaxation, flow and shock methods, flash photolysis, NMR and ESR methods of studying fast reactions.
- 1.5 Reactions in solution: Factors determining reaction rates in solutions, effect of dielectric constant and ionic strength, cage effect, Bronsted-Bjerrum equation, primary and secondary kinetic salt effect.
- 1.6 Acid-base catalysis: Specific and general catalysis, Skrabal diagram, Bronsted catalysis law, prototropic and protolytic mechanism with examples, acidity function.
- 1.7 Enzyme catalysis and its mechanism, Michaelis-Menten equation, effect of pH and temperature on enzyme catalysis.
- 1.8 Introduction to oscillating chemical reactions: autocatalysis, autocatalytic mechanism of oscillating reactions, the Lotka-Volterra mechanism, the Brusselator, the Oregonator, bistability.

## **Unit 2: Surface Chemistry**

**(27 Hrs)**

- 2.1 Different types of surfaces, thermodynamics of surfaces, Gibbs adsorption equation and its verification, surfactants and micelles, surface films, surface pressure and surface potential and their measurements and interpretation.
- 2.2 Application of low energy electron diffraction and photoelectron spectroscopy, ESCA and Auger electron spectroscopy, scanning probe microscopy-AFM and STM, ion scattering, SEM and TEM in the study of surfaces.
- 2.3 Surface Enhanced Raman Scattering, surfaces for SERS studies, chemical enhancement mechanism, surface selection rules, principle and application of SERS in surface chemistry.
- 2.4 Adsorption: The Langmuir theory, kinetic and statistical derivation, multilayer adsorption-BET theory, Use of Langmuir and BET isotherms for surface area determination. Application of Langmuir adsorption isotherm in surface catalysed reactions, the Eley-Rideal mechanism and the Langmuir-Hinshelwood mechanism, flash desorption.
- 2.5 Colloids: structure and stability, the electrical double layer, zeta potential, electrokinetic phenomena- sedimentation potential and streaming potential, Donnan membrane equilibrium.
- 2.6 Macromolecules: Different averages, methods of molecular mass determination - osmotic, viscosity, sedimentation and light scattering methods.

## **Unit 3: Crystallography**

**(18 Hrs)**

- 3.1 Miller indices, point groups (derivation not expected), translational symmetry, glide planes and screw axes, space groups, simple cases like triclinic and monoclinic systems, interplanar spacing and method of determining lattice types, reciprocal lattices, methods of characterizing crystal structure, rotating crystal method, powder X-ray diffraction method, determination of structure of sodium chloride by powder method, comparison of the structures of NaCl and KCl, brief outline of single crystal X-ray diffraction and crystal growth techniques.
- 3.2 Structure factor: Atomic scattering factor, coordinate expression for structure factor, structure by Fourier synthesis.
- 3.3 Liquid crystals: Mesomorphic state, types, examples and application of liquid crystals.

## CH 50 03 04      SPECTROSCOPIC METHODS IN CHEMISTRY

Credit :4

Contact Lecture Hours: 54

### Objective of the Course

The learners should be able to apply the different spectroscopic methods to solve problems based on it, spectral data for explaining important organic reactions and functional transformations.

### Unit 1: Ultraviolet-Visible and Chiro-optical Spectroscopy (9 Hrs)

- 1.1 Energy levels and selection rules, Woodward-Fieser and Fieser-Kuhn rules.
- 1.2 Influence of substituent, ring size and strain on spectral characteristics. Solvent effect, Stereochemical effect, non-conjugated interactions. Chiro-optical properties-ORD, CD, octant rule, axial haloketone rule, Cotton effect-applications.
- 1.3 Problems based on the above topics.

### Unit 2: Infrared Spectroscopy (9 Hrs)

- 2.1 Fundamental vibrations, characteristic regions of the spectrum (fingerprint and functional group regions), influence of substituent, ring size, hydrogen bonding, vibrational coupling and field effect on frequency, determination of stereochemistry by IR technique.
- 2.2 IR spectra of C=C bonds (olefins and arenes) and C=O bonds.
- 2.3 Problems on spectral interpretation with examples.

### Unit 3: Nuclear Magnetic Resonance Spectroscopy (18 Hrs)

- 3.1 Magnetic nuclei with special reference to  $^1\text{H}$  and  $^{13}\text{C}$  nuclei. Chemical shift and shielding/deshielding, factors affecting chemical shift, relaxation processes, chemical and magnetic non-equivalence, local diamagnetic shielding and magnetic anisotropy.  $^1\text{H}$  and  $^{13}\text{C}$  NMR scales.
- 3.2 Spin-spin splitting: AX, AX<sub>2</sub>, AX<sub>3</sub>, A<sub>2</sub>X<sub>3</sub>, AB, ABC, AMX type coupling, first order and non-first order spectra, Pascal's triangle, coupling constant, mechanism of coupling- Dirac model. Karplus curve, quadrupole broadening and decoupling, homotopic, enantiotopic and diastereotopic protons, virtual coupling, long range coupling. NOE and cross polarization.
- 3.3 Simplification non-first order spectra to first order spectra: shift reagents, spin decoupling and double resonance, off resonance decoupling. Chemical shifts and homonuclear/heteronuclear couplings. Basis of heteronuclear decoupling.
- 3.4 2D NMR and COSY, HOMOCOSY and HETEROCOSY

3.5 Polarization transfer, selective population inversion, DEPT., sensitivity enhancement and spectral editing, MRI.

3.6 Problems on spectral interpretation with examples

**Unit 4: Mass Spectrometry (9 Hrs)**

4.1 Molecular ion: Ion production methods (EI). Soft ionization methods: SIMS, FAB, CA, MALDI-TOF, PD, field desorption electrospray ionization, fragmentation patterns (polyenes, alkyl halides, alcohols, phenols, aldehydes and ketones, esters), nitrogen and ring rules, McLafferty rearrangement and its applications, HRMS, MS-MS, LC-MS, GC-MS.

4.2 Problems on spectral interpretation with examples.

**Unit 5: Structural Elucidation Using Spectroscopic Techniques (9 Hrs)**

5.1 Identification of structures of unknown organic compounds based on the data from UV-Vis, IR,  $^1\text{H}$  NMR and  $^{13}\text{C}$  NMR spectroscopy (HRMS data or Molar mass or molecular formula may be given).

5.2 Interpretation of the given UV-Vis, IR and NMR spectra.

5.3 Spectral analysis of the following reactions/functional transformations:

1. Pinacol-Pinacolone rearrangement
2. Benzoin condensation
3. (4+2) cycloaddition
4. Beckmann rearrangement
5. Cis-trans isomerisation of azo compounds
6. Benzil-benzilic acid rearrangement
7. Fries rearrangement

**SEMESTER 4**  
**ELECTIVE COURSES**

(Any one group of 3 courses to be opted from the following two groups)

**GROUP A**

**CH 80 04 01 ADVANCED INORGANIC CHEMISTRY**

**Credit: 4**

**Contact Lecture Hours: 90**

**Objective of the course**

To analyse and apply group theoretical principles in hybridisation technique of molecules, in complexes for explaining well known theories. To have a knowledge about the preparation and characteristics of nanomaterials, metal organic frame works and types of supramolecules

**Unit 1: Applications of Group Theory**

**(27 Hrs)**

- 1.1 Transformation properties of atomic orbitals, hybridization schemes for sigma and pi bonding with examples, symmetry adapted linear combination of atomic orbitals in tetrahedral, octahedral and sandwich complexes- ferrocene, formation of symmetry adapted group of ligand, MO diagrams.
- 1.2 Ligand field theory, splitting of d orbitals in different environments using group theoretical considerations, construction of energy level diagrams, correlation diagrams, method of descending symmetry, splitting terms for orbitals, energy levels, d-d transition-selection rules. Determination of modes of vibrations in IR and Raman spectra using character tables in tetrahedral, octahedral and square planar complexes.

**Unit 2: Inorganic Spectroscopic Methods**

**(9 Hrs)**

- 2.1 Infrared and Raman Spectroscopy: Structural elucidation of coordination compounds containing the following molecules/ions as ligands-NH<sub>3</sub>, H<sub>2</sub>O, CO, NO, OH<sup>-</sup>, SO<sub>4</sub><sup>2-</sup>, CN<sup>-</sup>, SCN<sup>-</sup>, NO<sub>2</sub><sup>-</sup> and X<sup>-</sup> (X=halogen). Use of isotopes in interpreting and assigning vibrational spectra.
- 2.2 Electron Paramagnetic Resonance Spectroscopy: EPR of d<sup>1</sup> and d<sup>9</sup> transition metal ions in cubic and tetragonal ligand fields, evaluation of g values and metal hyperfine coupling constants, electron-electron interactions, multiple resonance.
- 2.3 Mössbauer Spectroscopy: Applications of Mössbauer spectroscopy in the study of Fe(III) complexes. Compound Identification- the interhalogen compound I<sub>2</sub>Br<sub>2</sub>Cl<sub>4</sub>, iron in very high oxidation states – Fe(V) and Fe(VI) nitride complexes.

### **Unit 3: Inorganic Photochemistry**

**(9 Hrs)**

- 3.1 Excited states in transition metal complexes: Intra-ligand excited states and metal-centred excited states. Photochemical reactions: Substitution and redox reactions of Cr(III), Co(III), Rh(III) and Ru(II) complexes, manganese-based photosystems for the conversion of water into oxygen, applications-synthesis and catalysis, chemical actinometry and photochromism, metal-metal multiple bonds, dissociative photochemistry, ligand loss.
- 3.2 Metal complex sensitizers, electron relay, semiconductor supported metal oxide systems, water photolysis, nitrogen fixation and CO<sub>2</sub> reduction, dinitrogen splitting.

### **Unit 4: Nanomaterials**

**(18 Hrs)**

- 4.1 Inorganic nanomaterials: General introduction to nanomaterials, synthesis and applications of nanoparticles of gold, silver, rhodium, palladium and platinum, synthesis and applications of metal oxides of transition and non-transition elements-SiO<sub>2</sub>, TiO<sub>2</sub>, ZnO, Al<sub>2</sub>O<sub>3</sub>, iron oxides and mixed metal oxide nanomaterials, non-oxide inorganic nanomaterials, porous silicon nanomaterials- fabrication and chemical and biological sensing applications.
- 4.2 Characterisation of Nanomaterials: UV-visible, Raman, XRD, SEM, TEM and AFM techniques.
- 4.3. Diversity in nanosystems: Self-assembled monolayers on gold-growth process and phase transition, gas phase clusters- formation, detection and analysis, quantum dots- preparation, characterization and applications, nanoshells-types of systems, characterization and application, inorganic nanotubes-synthetic strategies, structures, properties and applications. Nanocomposites- natural nanocomposites, polymer nanocomposites, metal and ceramic nanocomposites and clay nanocomposites.
- 4.4. Evolving interfaces of nanotechnology: Nanobiotechnology, nano-biosensors, nanotechnology for manipulation of biomolecules- optical tweezers, dielectrophoresis, biochips, labs on chips, and integrated systems, nanocatalysts, nanomedicines- importance of nanomaterials in the pharmaceutical industry and future possibilities for medical nanotechnology, nanoparticles for medical imaging, nanoparticles for targeting cancer cells, nanoencapsulation for drug delivery to tumours.

### **Unit 5: Chemistry of Materials**

**(9 Hrs)**

- 5.1 Ceramic Structures: Mechanical properties, clay products, refractories- characterisation, properties and applications, non-silicon semiconductors as light emitting diodes, thermoelectric (TE) materials, applications of metals and alloys in hydrogen storage, inorganic organic hybrid composites- sol-gel ceramics, fillers in elastomers, polymer-modified ceramics.

- 5.2 Synthetic strategies for inorganic material design: Direct Combination, low temperature techniques, combinatorial synthesis.

**Unit 6: Metal Organic Frame Works (9 Hrs)**

- 6.1 Introduction, porous coordination polymers, frameworks with high surface area, Lewis acid frameworks, soft porous crystals, design of metal organic frameworks and design of functional metal organic frameworks by post-synthetic modification.
- 6.2 Applications of metal organic frameworks- separation and purification of gases by MOFs, hydrogen storage, MOFs in the pharmaceutical world.

**Unit 7: Inorganic Supramolecular Chemistry (9 Hrs)**

- 7.1 Types of Supermolecules, examples of inorganic supermolecules, synthetic strategies for inorganic super molecules and coordination polymers, molecular polygons and tubes, molecular polyhedra.
- 7.2 Diamondoid networks, inorganic crystal engineering using hydrogen bonds, organometallic crystal engineering, supramolecular self-assembly caused by ionic interactions- hydrocarbyls, amides and phosphides.

## CH 80 04 02      ADVANCED ORGANIC CHEMISTRY

Credit : 4

Contact Lecture Hours: 90

### Objective of the Course

To analyse and interpret molecular recognition and supramolecular chemistry, to study the basic principles of green chemistry, the method of biosynthesis and biomimetic synthesis, to learn the importance of drug design and different categories of polymers. To understand the basic principles of research and how to write a scientific report

### **Unit 1: Molecular Recognition and Supramolecular Chemistry (18 Hrs)**

- 1.1 Introduction to supramolecular chemistry: Host, Guest, Host-Guest complex, Lock and key principle, Preorganisation, Complementarity.
- 1.2 Molecular recognition, forces involved in molecular recognition.
- 1.3 Cation binding Hosts: Crown ethers, Lariat ethers, Podands, Cryptands, Spherands, Calixarenes
- 1.4 Anion binding hosts: Cyclophanes. A naturally occurring cyclic host: Cyclodextrin - industrial applications.
- 1.5 Molecular clefts and tweezers. Macrocyclic polyamines – Nitrogen based cyclic hosts.
- 1.6 Naturally occurring Siderophores. Rhodopsin – A Supramolecular photonic device.

### **Unit 2: Green Alternatives to Organic Synthesis (9 Hrs)**

- 2.1 Introduction to Green Chemistry, atom economy
- 2.2 Twelve principles of Green Chemistry, how to plan a green synthesis.
- 2.3 Green Solvents: Ionic liquids, supercritical CO<sub>2</sub>, fluoruous solvents, PEG
- 2.4 Microwave assisted organic synthesis : Principle, example.
- 2.5 Sonochemical synthesis : Principle, example
- 2.6 Green alternatives to organic synthesis: Thiamine catalyzed benzoin condensation, Montmorillonite K-10 catalysed Pinacol-Pinacolone rearrangement, photochemical reduction of benzophenone to benzopinacol, synthesis of adipic acid from cyclohexene, synthesis of Ibuprofen.

### **Unit 3: Biosynthesis and Biomimetic Synthesis (9 Hrs)**

- 3.1 Basic principles of the biosynthesis of terpenes, steroids, alkaloids, carbohydrates, proteins and nucleic acids, biosynthesis of cholesterol,  $\alpha$ - terpineol, morphine, glucose

and phenyl alanine, biogenesis of isoprenoids and alkaloids, biomimetic synthesis of progesterone (Johnson synthesis).

**Unit 4: Stereoselective Transformations (9 Hrs)**

- 4.1 Asymmetric induction - chiral auxiliaries and chiral pool.
- 4.2 Enantioselective catalytic hydrogenation developed by Noyori and Knowels.
- 4.3 Asymmetric aldol condensation pioneered by Evans.
- 4.4 Asymmetric Diels-Alder reactions.
- 4.5 Enantioselective synthesis of Corey lactone

**Unit 5: Chemistry of Natural Products and Biomolecules (18 Hrs)**

- 5.1 Synthesis of camphor, atropine, papaverine, quinine, cyanin, quercetin,  $\beta$ -carotene, testosterone, biosynthesis of PGE<sub>2</sub> and PGF<sub>2</sub> $\alpha$ .
- 5.3 Structure of proteins, nucleic acids and methods for primary structure determination of peptides (N-terminal - Sanger's method and Edmond's method; C-terminal - Akaboro method and carboxy peptidase method), replication of DNA, flow of genetic information, protein biosynthesis, transcription and translation, genetic code, regulation of gene expression, DNA sequencing, The Human Genome Project, DNA profiling and the Polymerase Chain Reaction (PCR).

**Unit 6: Medicinal Chemistry and Drug Designing (9 Hrs)**

- 6.1 Introduction to Drug design: Modelling techniques, receptor proteins, drug-receptor interaction, drug action, drug selectivity, drug metabolism (Phase I and Phase II).
- 6.2 Mode of action of Warfarin (anticoagulant), organic nitrates (anti-anginal drug), Captopril (antihypertensive agent), Chloroquin (antimalarial drug).
- 6.3 Antibiotics: Penicillins (SAR expected), mode of action of chloramphenicol, tetracyclins and cephalosporins, drugs for cancer (Methotrexate), AIDS (Zidovudin) and diabetes (Metformin).

**Unit 7: Advances in Polymer Chemistry (9 Hrs)**

- 7.1 Conducting polymers, temperature resistant and flame retardant polymers, polymers for medical applications.
- 7.2 Dendrimers and dendritic polymers: Terminology, classification of dendrimers. Methods of synthesis: convergent and divergent approaches, applications of dendrimers. Hyperbranched polymers: Definition, synthesis, applications.

## **Unit 8: Research Methodology of Chemistry**

**(9 Hrs)**

- 8.1 The search of knowledge, purpose of research, scientific methods, role of theory, characteristics of research.
- 8.2 Types of research: Fundamental, applied, historical and experimental research.
- 8.3 Chemical literature: Primary, secondary and tertiary sources of literature. Classical and comprehensive reference. Literature databases: ScienceDirect, SciFinder. Chemical Abstract.
- 8.4 Scientific writing: Research reports, thesis, journal articles, books. Types of publications: articles, communications, reviews.
- 8.5 Important scientific and Chemistry Journals. Impact factor.

## CH 80 04 03      **ADVANCED PHYSICAL CHEMISTRY**

**Credit: 4**

**Contact Lecture Hours: 90**

### **Objective of the course**

To know the excited states involved in a photochemical reaction, to analyse and apply diffraction methods and atomic spectroscopic techniques. The students should be able to apply theories in electrochemistry to analyse the kinetics of electrode reactions.

### **Unit 1: Photochemistry** **(18 Hrs)**

- 1.1 Quantum yield, chemical actinometry, excimers and exciplexes, photosensitization, chemiluminescence, bioluminescence, thermoluminescence, pulse radiolysis, hydrated electrons, photostationary state, dimerization of anthracene, ozone layer in the atmosphere.
- 1.2 Principle of utilization of solar energy: solar cells, types of solar cells-amorphous silicon solar cell, cadmium telluride solar cell, copper indium gallium selenide solar cell.
- 1.3 Quenching of fluorescence and its kinetics, Stern-Volmer equation, concentration quenching, fluorescence and structure, delayed fluorescence, E-type and P-type, effect of temperature on emissions, photochemistry of environment, green house effect, two photon absorption spectroscopy, lasers in photochemical kinetics.

### **Unit: 2 Fluorescence Spectroscopy** **(9 Hrs)**

- 2.1 Instrumentation: light source, monochromator, optical filters, photomultiplier tube, polarizers, fluorescence sensing, mechanism of sensing, sensing techniques based on collisional quenching, energy transfer and electron transfer, examples of pH sensors. Novel fluorophores: long life time metal-ligand complexes.

### **Unit 3: Diffraction Methods and Atomic Spectroscopic Techniques** **(9 Hrs)**

- 3.1 Electron diffraction of gases, Wierl's equation, Neutron diffraction method, Comparison of X-ray, electron and neutron diffraction methods.
- 3.2 Atomic absorption spectroscopy (AAS), principle of AAS, absorption of radiant energy by atoms, classification of atomic spectroscopic methods, measurement of atomic absorption, instrumentation.
- 3.3 Atomic emission spectroscopy (AES), advantages and disadvantages of AES, origin of spectra, principle and instrumentation.
- 3.4 Flame emission spectroscopy (FES), flames and flame temperature, spectra of metals in flame, instrumentation.

#### **Unit 4: Electrochemistry and Electromotive Force**

**(27 Hrs)**

- 4.1 Theories of ions in solution, Drude and Nernst's electrostriction model and Born's model, Debye-Huckel theory, derivation of Debye-Huckel-Onsager equation, validity of DHO equation for aqueous and non aqueous solutions, Debye-Falkenhagen effect, conductance with high potential gradients, activity and activity coefficients in electrolytic solutions, ionic strength, Debye-Huckel limiting law and its various forms, qualitative and quantitative tests of Debye-Huckel limiting equation, deviations from the DHLL, ion association, triple ions and conductance minima.
- 4.2 Electrochemical cells, concentration cells and activity coefficient determination, liquid junction potential, evaluation of thermodynamic properties, the electrode double layer, electrode-electrolyte interface, different models of double layer, theory of multilayer capacity, electro capillary, Lippmann equation, membrane potential.
- 4.3 Fuel cells- Theory and working of fuel cells- methanol fuel cell, H<sub>2</sub>-O<sub>2</sub> fuel cell and solid oxide fuel cells.
- 4.4 Corrosion and methods of prevention, Pourbaix diagram and Evans diagrams.
- 4.5 Overvoltage: hydrogen and oxygen overvoltage, theories of overvoltage, Tafel equation and its significance, Butler-Volmer equation for simple electron transfer reactions, transfer coefficient, exchange current density, rate constants.

#### **Unit 5: Electroanalytical Techniques**

**(18 Hrs)**

- 5.1 Voltametry: Cyclic voltametry, ion selective electrodes, anodic stripping voltametry.
- 5.2 Polarography-decomposition potential, residual current, migration current, supporting electrolyte, diffusion current, polarogram, half wave potential, limiting current density, polarograph, explanation of polarographic waves.
- 5.3 The dropping mercury electrode, advantages and limitations of DME, quantitative analysis- pilot ion procedure, standard addition methods, qualitative analysis- determination of half wave potential of an ion, advantages of polarography.
- 5.4 Amperometric titrations: General principles of amperometry, instrumentation, application of amperometry in the qualitative analysis of anions and cations in solution, merits and demerits of amperometric titrations.
- 5.5 Coulometry: Coulometer-Hydrogen Oxygen coulometers, silver coulometer, coulometric analysis with constant current, coulometric titrations, application of coulometric titrations-neutralization titrations, complex formation titrations, redox titrations, advantages of coulometry.

**Unit:6 Advanced Thermodynamics****(9 hrs)**

- 6.1 Thermodynamics of irreversible processes with simple examples, general theory of non-equilibrium processes, entropy production, the phenomenological relations, the principle of microscopic reversibility, Onsager reciprocal relations, thermal osmosis and thermoelectric phenomena.
- 6.2 Bioenergetics, coupled reactions, ATP and its role in bioenergetics, high energy bond, free energy and entropy change in ATP hydrolysis, thermodynamic aspects of metabolism and respiration, glycolysis, biological redox reactions.

**SEMESTERS 3 AND 4****CH 01 04 05INORGANIC CHEMISTRY PRACTICAL-2****Credit: 3****Contact Lab Hours: 54+54 =108****Objective of the Course**

They must be able to apply theoretical learning to separate simple binary mixtures of metallic ions in solution, analysis of alloys and application of paper chromatography to separate a mixture of three cations

**PART I**

Estimation of simple binary mixtures (like Cu-Ni, Cu-Zn, Fe-Cr, Fe-Cu, Fe-Ni, Pb-Ca) of metallic ions in solution by volumetric and gravimetric methods.

**PART II**

Analysis of one of the alloys of brass, bronze and solder. Analysis of one of the ores from hematite, chromite, dolomite, monazite, ilmenite.

**PART III**

Paper chromatographic Separation of a mixture of 3 cations.

- (a) Separation of Ag(I), Pb(II) and Hg(II) ions
- (b) Separation of Ni(III), Co(II) and Zn(II) ions
- (c) Separation of Ni(III), Co(II) and Cu(II) ions
- (d) Separation of Ba(II), Sr(II) and Ca(II) ions

**PART IV**

- (a) Preparation of cis and trans-Dichlorobis(ethylenediamine)cobalt(III) chloride and kinetic study of cis to trans isomerisation using a UV-vis spectrophotometer.
- (b) Synthesise the following complexes of Ni(II) (a d8 system) and prepare 0.05M solutions of the complexes in the solvents specified.

Complex

Solvent and Blank.

Concentration

1. $[\text{Ni}(\text{bipy})_3]\text{SO}_4 \cdot 6\text{H}_2\text{O}$	Water	0.05M
2. $[\text{Ni}(\text{en})_3]\text{Cl}_2 \cdot 2\text{H}_2\text{O}$	20% en	0.05M
3. $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$	Aqueous $\text{NH}_3$	0.05M
4. $[\text{Ni}(\text{H}_2\text{O})_6]\text{SO}_4$	Water	0.05M
5. $[\text{Ni}(\text{DMSO})_6](\text{ClO}_4)_2$	DMSO	0.05M
6. $\text{K}_4[\text{Ni}(\text{NCS})_6]4\text{H}_2\text{O}$	10M KSCN in water	0.05M

Record the electronic spectrum of each solution in the region 200 – 1100 nm. Calculate  $\Delta$  values for all six complexes. Arrange the ligands in the spectrochemical series i.e. in the order of increasing  $\Delta$ .

(c) Estimation of equilibrium constant of the reaction,  $\text{Fe}^{3+} + \text{SCN}^- \leftrightarrow \text{FeSCN}^{2+}$  with the help of a colorimeter or UV-vis spectrophotometer.

## CH 01 04 06      ORGANIC CHEMISTRY PRACTICAL-2

**Credit: 3**

**Contact Lab Hours: 54+54=108**

They should be able to apply classroom learning for the preparation of organic compounds by two step synthetic sequences. They should also be capable of applying green alternative methods of synthesis

### **PART I**

#### **Preparation Involving Two step Synthetic Sequences by Chemical Methods**

- (1) Metanitrobenzoic acid from methyl benzoate
- (2) Paranitroaniline from acetanilide
- (3) 1,3,5-tribromoaniline from acetanilide
- (4) Parabromoaniline from acetanilide
- (5) Benzanilide from benzophenone
- (6) Schiff's base from aniline
- (7) Paracetamol from phenol
- (8) Phenol from aniline
- (9) Methyl red from anthranilic acid
- (10) Para nitrobenzoic acid from toluene

### **PART II**

**Spectrophotometric (UV-Vis) estimations of organic compounds (eg: Nitro compounds, azo compounds etc.)**

### **PART III**

#### **Preparation Involving Multistep Synthetic Sequences by the Green Alternatives of Chemical Methods**

- (1) 1,1-bis -2-naphthol from 2-naphthol
- (2) Benzopinacol from benzophenone
- (3) Benzopinacolone from Benzopinacol
- (4) o-Methyl acetanilide from o-toluidine
- (5) Acetanilide from aniline

### **PART IV**

#### **Microwave assisted Organic Synthesis**

- (1) Benzoic acid from ethyl benzoate

- (2) Benzoic acid from benzyl alcohol
- (3) Ethyl-3-nitrobenzoate from 3-nitrobenzoic acid
- (4) 2-hydroxychalcone from salicylaldehyde
- (5) Anthracene-maleic anhydride adduct

#### **PART V**

Prediction of FTIR, UV-Visible,  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra of the substrates and products at each stage of the products synthesized by the above methods.

## CH 01 04 07 PHYSICAL CHEMISTRY PRACTICAL 2

**Credit: 3**

**Contact Lab Hours: 72+72=144**

### **Objective of the Course**

Analyse and apply the theoretical principles of various branches of physical chemistry whereby class room learning can be transformed to laboratory practice

#### **I. Chemical Kinetics**

1. Determination of the rate constant of the hydrolysis of ester by sodium hydroxide
2. Determination of the rate constant of the hydrolysis of ester by acid
3. Kinetics of reaction between  $K_2S_2O_8$  and KI.

#### **II Polarimetry**

1. Kinetics of the inversion of sucrose in presence of HCl.
2. Determination of the concentration of a sugar solution
3. Determination of the concentration of HCl
4. Determination of the relative strength of acids

#### **III Refractometry**

1. Identification of pure organic liquids and oils
2. Determination of molar refractions of pure liquids
3. Determination of concentration of solutions (KCl-Water, Glycerol—water)
4. Determination of molar refraction of solids
5. Study of complex formation between potassium iodide and mercuric iodide system

#### **IV Viscosity**

1. Determination of viscosity of pure liquids
2. Verification of Kendall's equation—full experiment
3. Determination of composition of binary liquid mixture (toluene-nitrobenzene)
4. Determination of molecular weight of a polymer (polystyrene in toluene)

#### **V Conductance Measurements**

1. Titration of a dibasic acid against strong base
2. Titration of a mixture of acids against a strong base
3. Titration of weak acid vs strong base
4. Verification of Onsager equation

5. Determination of dissociation constant of a weak acid

## **VI Potentiometry**

1. Titration of strong acid vs strong base
2. Titration of weak acid vs strong base
3. Titration of a mixture of acids against a strong base
4. Application of Henderson equation
5. Determination of single electrode potential (Cu and Zn)
